

PROPOSED SOLUTION

Sequence 1

- 1) Payload will be close to (Email, Card Number, CustomerGuid, Phone, BatchId)
- 2) Find the user that match any of these identifier
- 3) Update user status in B2C and SQL to suspended (B2C we have to update the flag)
- 4) Using the BatchId in Azure table storage find that entry and update the status fields as per above operations
Like. Success, Failure, Failed Reason, etc..
- 5) Also update the Summary table just increment the count of success / failure (in summary table by default all the record will count as a processing status)
