

Sequence Diagram

Processing

Document Creating Logic:

- Each Transaction will create one transaction document but it will not be saved in cosmos instead directly moved to internal EventHub and fyi... Make sure to add sourceTransactionNumber in Transaction document as well
- Every Point Item Array will create point Document
- Transaction Id and Point Transaction Id will be store as sourceTransactionNumber in transaction document and SourcePointTransactionId in point doc
- OfferCode, Id and Name will be added in point document under offer section
- PointDocument will have a flag stating this is created by SF (for now this will not have any use but it will help in reporting from datalake for future use)
- At the end of successful processing we will create transactionlog document in real time
- Awarded point also will be available in the request point item array

Duplicate Logic:

- We will check the Point Document in COSMOS against CustomerUniqueld and SourcePointTransactionId and sourceTransactionNumber and match found then it is count as a duplicate Point Transaction
- And lets say if request have a two point array and one found in duplicate logic but not other then we will only process the transaction that is not processed and after successful we will send the response in Internal EventHub API Log container will message and status code of 207 with explanation which one we processed and which we found as a duplicate

Response Delivery Logic:

- Status of the request weather it is success or failure will be send to API Log topic of Internal EventHub with Partner Salesforce, Ack Token and Status Code that could be 200,400,500,207 and Message only if applicable
- New Logic App Needs to be created (simply clone from existing) that will read the data from API Log and Send it to New APIResponse topic in Partner destination EventHub. APIResponse topic needs to be created in Partner destination EventHub
- That logic App will filter the data against the partner Salesforce and ignore rest of it and only send those to destination EventHub
