

Sequence 1

Only perform this logic for the point document and partner code is "Windmill" that is config value

- 1) check if this customer guid is present in the redis
- 2) If not then update the customer table in database and set "True" value to field called "Transacted"
- 3) Once DB update is done then insert that customer guild to Redis
- 4) Update in database will trigger the CDC trigger
- 2a) And if Customer guid is present in redis to don't do anything

Whenever we have to force user details stream to Windmil just setting this flag will trigger this solution automatically
